

XAVI BOSCH

INTERACTIVE PRODUCT DESIGN AND CREATION · 18 · BARCELONA

I design and build interactive products end to end: research, interface, code, data model and, when the thing needs one, the electronics. I work fast, put it in front of someone, then keep using it myself, which is where the problems that actually matter turn up, long after the thing was called finished.

HOW I WORK

Foundations before features.
I built the features before the connection underneath them, so each one had to survive a dropped link on its own. Rebuilding the channel layer first made everything added after it hold up without being asked.

Verify on the real thing, not the stand in.
I tuned haptics against a simulator, where a vibration is a line in a log. On a real device the patterns I was proudest of were the ones you could not tell apart in the hand.

Isolate before integrating.
Debugging an assembled machine, with motors, sensors and radio all live at once, cost hours and proved nothing. Testing each part alone found the fault in minutes.

Cutting a feature is a result.
A swipe gesture kept firing by accident and no guard fixed it. The finger doing the swiping was also the cursor, so the gesture was ambiguous by construction rather than badly tuned. I deleted it.

The truth belongs in the data, not the screen.
Two people could settle the same bet, because nothing in a static screen says who owns that write. The rules decide and the interface is only allowed to ask.

Agree the contract before building behind it.
Working in a pair we kept blocking each other: neither could start until the other had finished the class underneath. Settling the interfaces between the layers first let us both build against a contract instead of against each other's unfinished work.

Access is not worth someone's privacy.
Full shell access made every feature easy and left a camera in someone's living room behind a door I had opened. I rebuilt on a narrow set of commands and lost features for it.

WHERE THIS COMES FROM

Ten products designed and built end to end, and none of them is a mockup. Several are deployed and in daily use. One is the only way somebody I know can operate their television. Several pair software with hardware I wired myself. One was shaped by real user testing: sessions, a mapped customer journey and defined target users. The rest were built for people I can name.

OPEN TO

Internships and junior work in interactive product design, front end development and product, in Barcelona or abroad. Comfortable being the person who decides what to build and then builds it.

EDUCATION

Interactive Product Design and Creation
La Salle, Universitat Ramon Llull, Barcelona.
First year complete, 60 ECTS. Second year from September 2026.

LANGUAGES

Catalan · native
Spanish · native
English · C1 advanced

TOOLS

Code
Swift, SwiftUI, Python, Java, JavaScript, React, Electron, Git, UML.

Data and services
Firebase with Firestore, Realtime Database and security rules. MQTT. Ollama for local models.

Sensing and interaction
OpenCV, MediaPipe, Vosk offline speech, Core Haptics, spatial audio, NFC, Wake on LAN.

Hardware
Arduino, ESP32, sensors and actuators, ADC, serial.

Design and media
Figma, Illustrator, Maya, ZBrush, Premiere.

COVERED IN THE DEGREE

Experience design
Inclusive design
Interface and graphic design
Programming
Electronics
3D, animation and story
