EDUCATION

BSc in Interactive Product Design and Creation
salleurl.edu
La Salle, Universitat Ramon Llull, Barcelona. First year complete, 60 ECTS. Second year from September 2026.

LANGUAGES

Catalan · native
Spanish · native
English · C1 advanced

CORE TECHNOLOGIES

Swift and SwiftUI, Python, React and TypeScript, JavaScript, Firebase with Firestore and security rules, OpenCV and MediaPipe, AI tooling, Git and GitHub, Figma.

ALSO WORKED WITH

Java and object orientation, UML, Electron, Vite, Vosk, Core Haptics, MQTT, Vercel, Ollama for local models, Arduino and ESP32, Illustrator, Maya, ZBrush, Premiere.

COMPETENCIES

Teamwork, autonomous learning, persistence, problem solving, talking to the people who will actually use what I make, accessible and inclusive design.

WHO I AM

Second year student of Interactive Product Design and Creation at La Salle. What I actually like is the part where design and code meet: working out how a thing should feel and then building it myself, from the interface to the data model and, when it is needed, the electronics. Almost everything I know I learned by making things and repeating them until they worked, through practice and stubbornness rather than a course. What interests me most is removing steps between wanting to do something and doing it, and when something is beyond me I stay with it until I understand it.

HOW I WORK

When something breaks, I take it apart before touching it remote-robot-car
With the remote controlled car I spent hours debugging the whole thing, with the motors, the sensors and the radio all running at once, and got nowhere. As soon as I tested each part on its own I found the fault in minutes.

I start with the base, not with what you can see jeffrey-remote
On Jeffrey's remote I built the features first and the connection afterwards, so each one had to survive a dropped network on its own. I rebuilt the connection layer from the bottom and everything I added after that already worked remotely without asking.

I do the research before drawing any screens betsy-ios
On Betsy I defined who it was for, mapped the user journey and ran tests with real people before building the interface. What came out of that changed the design far more than any idea of my own.

I trust nothing until I have tried it on the real device haptic-hunter
I tuned the vibrations in Haptic Hunter on the simulator, where a vibration is a line in a log. On a real phone the patterns I liked most were exactly the ones you could not tell apart in your hand.

Sometimes fixing something means removing it reps
In Reps I built a gesture to change exercise and it kept firing on its own. I added conditions and it still failed, until I understood that the finger doing the swipe is the same one acting as the cursor, so the gesture was indistinguishable by design. I deleted it and left buttons.

I am comfortable on a team, and step one is agreeing lasallefy-java
laSallefy was built by two of us and at the start we kept blocking each other, because neither could begin until the other finished their part. We sat down to decide how the pieces would talk to each other and from there we could each move without waiting.

I use AI every day, but never blindly
AI is one more tool and it makes me a lot faster, but I take nothing as good without understanding it. If I do not know why something works I stop until I do, because what I do not understand I cannot fix the day it breaks.

OPEN TO

Internships and junior work in interactive product design, front end development and product, in Barcelona or abroad.
